Summary

By 2014 Finland already surpassed its 2020 target for renewable energy use under the 2009 EU Renewable Energy Directive. At present, the main support scheme is a technology-neutral premium-based tender scheme for producers of electricity from wind, solar, biogas, biomass wood fuels and wave power. The feed-in premium scheme with administratively determined premium levels for renewable electricity from wind, biomass and biogas used to be the main support scheme. As per ultimo 2018 this scheme has been closed for new applicants by developers of new biogas and wood fuel based power projects and it will be phased out altogether in due time. Renewable electricity generation projects are also supported by state subsidies. The main support mechanism for heat produced from RES is a “heat bonus” allocated to CHP plants working on biogas and wood fuel. In transport, the main incentive for renewable energy use is a biofuels quota system.

Abbreviations used:
RES: renewable energy sources
RES-E: renewable electricity
RES-H/C: renewable heating/cooling
RES-T: renewable transport fuels

Hydropower jobs & turnover only covers ‘small hydropower’. PV=Photovoltaics, CSP=Concentrated Solar Power. Biofuels in transport only covers compliant fuels (employment and turnover additionally cover the non-compliant biofuels). Derived heat includes heat produced in main activity producer plants and heat sold produced in autoproducer plants. Its counterpart is the final heat consumption in the final consumption sectors (such as households).
CURRENT RENEWABLE ENERGY POLICY

In November 2016 the Finnish government published the new Energy and Climate Strategy, outlining actions geared at enabling Finland in attaining the targets specified in the Government Programme and adopted in the EU for 2030, and to contribute to the EU achieving an 80–95% reduction in greenhouse gas emissions by 2050.

According to Finland’s national energy and climate strategy to 2030 published on 24 November 2016, investment subsidies for renewable energy are mainly targeted towards commercialising new technology and the effort sharing sector, i.e. sectors that are not covered under the European Union’s emissions trading scheme (EU ETS), especially towards institutions producing advanced transport biofuels. In addition, the use of agricultural, societal and industrial waste and side streams in the production of heat and electricity as well as transport fuel is promoted.

Electricity from renewable sources is promoted mainly through a technology-neutral tender-based premium scheme for electricity from wind, solar, biogas, biomass wood fuels and wave power. Per year, in total 1.4 TWh of renewable electricity is put up for tendered premium support. A variable premium paid over a 12 year period. The premium level is capped at €53.50 /MWh. It is based ex post on the difference between a maximum pay-as-bid target price of € 83.50 and the average benchmark electricity price over the past three months (or €/ MWh 30 if the average benchmark price is below the latter amount). The funding comes from the state budget. Until end of 2018 Finland used to support electricity from selected renewable energy sources (wind, biomass and biogas) for new applicants through a feed-in premium scheme with administratively determined rates. Only approved installations commissioned before 2019 and small new wind farms (with a capacity below 2.5 MW) remain eligible to this scheme. Furthermore, under two distinct schemes investment grants are available for inter alia renewable electricity projects, open to all renewable electricity generation technologies meeting certain requirements.

For renewable heat production in bio-based CHP plants (using biogas or wood fuel) meeting certain requirements, such as passing the applicable minimum efficiency threshold, a so-called “heat bonus” is granted. This heat price subsidy amounts to € 50 / MWh for biogas-based and € 20 / MWh for (solid) biomass-based CHP installations, paid from the state budget. Furthermore, under two distinct schemes investment grants are available for renewable heat projects, open to all renewable heat generation technologies meeting certain requirements. One of these schemes is targeted on farmers.

Renewable transport fuels are promoted via a biofuels quota scheme. This mechanism obliges companies selling petrol or diesel fuels to ensure that biofuels compose a defined percentage of the company’s total annual sales of fuel on an energy content basis. In addition, each component of transport fuels are taxed distinctly, based on energy content and carbon content. For (presumptively zero carbon) biofuel components the excise duty is less, which boils down to an additional incentive for biofuels. The costs of this tax relief for biofuels is borne by the state budget.

Electric vehicles are promoted by a package of measures, including:

- €2000 subsidy on the purchase of a battery electric vehicle (BEV) costing not more than €50000
- The owner of a BEV pays the minimum rate (5%) of the standard CO₂ gr/car-km emission rate based registration tax.
OVERVIEW OF MAIN SUPPORTING POLICIES

The main RES support measures applied in Finland are epitomized in Tables 1 and 2 below. See the previous section for more details.

<tr>
<td>Feed-in tariff/premium</td>
<td>Producers of electricity from renewable energy sources (wind, wood chip, biogas) receive a feed-in premium on top the wholesale electricity price.</td>
</tr>
<tr>
<td>Energy/investment subsidies (state grants)</td>
<td>The Finnish government provides subsidies for investment and research projects aimed at renewable energy generation. State grants are also provide for construction, expansion and renovation of heating facilities for agricultural production, where grant allocation is contingent on use of renewable energy sources.</td>
</tr>
<tr>
<td>Biofuel obligation</td>
<td>The main support scheme for promoting biofuels is a quota system, which obliges vendors to ensure that biofuels make up a certain percentage of their total annual sale of fuels.</td>
</tr>
<tr>
<td>Tax exemption (energy content and CO₂)</td>
<td>All transport fuels are taxed on their energy content and CO₂ emissions. Under the current tax regime, biofuels receive a tax rebate based on their lower energy content. The consideration of CO₂ emissions also provides a benefit for biofuels. The basis for CO₂ tax on biofuels is the carbon-dioxide emissions during their lifetime in comparison with their fossil equivalents. Unsustainable biofuels are subject to the same CO₂ tax as fossil fuels, sustainable biofuels are subject to 50 % of the CO₂ tax on the equivalent fossil fuel, and double-counted fuels under the RES Directive are not subject to any CO₂ tax.</td>
</tr>

What is meant by …?

Auctions for granting renewable energy support

An auction is a process of granting production or investment support to renewable energy projects based on the lowest bids by eligible project developers.

Feed-in tariff (FiT)

A support scheme which provides for a technology-specific remuneration per unit of renewable energy payable to eligible renewable energy producers. A proper, periodic review of FiT rates is often undertaken with the aim to prevent both too high FiTs so as to minimise regulatory rents, i.e. supra-normal returns and too low FiTs to preclude below-target market uptake because of FIT levels that are perceived by market participants to be less attractive. In addition, feed-in tariffs often include “tariff degression”, a mechanism according to which the price (or tariff) ratchets down over time.

Feed-in premium (FiP)

A scheme which provides for a support level per unit of renewable energy to eligible renewable energy producers, typically for a period of 10-20 years, at a pre-set fixed or floating rate. The premium is typically adjusted periodically to exactly offset change in the average energy wholesale market price, based on a pre-specified benchmark market price. A floating FiP may move freely or may only be allowed to move within a pre-set interval.

Grants

Grants are non-repayable funds disbursed by one party (grant makers), often a government department, corporation, foundation or trust, to a recipient, often (but not always) a non-profit entity, educational institution, business or an individual. (Source: Wikipedia.org)

Green public procurement

In Green public procurement contracting authorities take environmental issues into account when tendering for goods or services. The goal is to reduce the impact of the procurement on human health and the environment. (Source: Wikipedia.org)

Renewable quota scheme (RQS)

A RQS mandates certain market actors (typically retail suppliers or large energy end-users) to respect a pre-set minimum share or amount of their total energy procurements from renewable sources of energy. Typically a tradable green certificate (TGC) scheme is operated to enable the obligated parties to prove their compliance with the prevailing renewable quota target by means of TGCs.

Sliding feed-in-tariff

A FiT scheme which pre-sets technology-specific declining feed-in tariffs for certain prospective vintages in line with the technology-specific learning curve, as projected by the National Regulatory Agency (NRA). Often a degression rate is used indicating the %/annum decrease in the rate level.

Soft loans

Loans at concessional (below market-based) terms, for example at sub-market-conform interest rates, made available in several Member States to stimulate certain renewable energy technologies.

Tax credits

These are amounts a tax paying entity is allowed to deduct when declaring payable taxes, for example company tax or income tax, to the tax authorities, for example the producer tax credits (PTCs) used in the United States to stimulate among others wind energy deployment.
