Renewable Energy Policy Factsheet

Belgium

Renewable energy status

Share of energy from renewable sources in total gross final energy consumption

Abbreviations used:
RES: renewable energy sources
RES-E: renewable electricity
RES-H/C: renewable heating/cooling
RES-T: renewable transport fuels

Gap towards 2020: 1 305.8 - 1 846.6

FTE = Full time equivalent, PV=Photovoltaics, CSP=Concentrated Solar Power. Biofuels in transport only covers compliant fuels (employment and turnover additionally cover the non-compliant biofuels). Derived heat includes heat produced in main activity producer plants and heat sold produced in auto-producer plants. Its counterpart is the final heat consumption in the final consumption sectors (such as households).

1 From Integrated National Energy Climate Plan
2 Referring to the International Trade chapter from the publication: EurObserv'ER - The State of Renewable Energy in Europe, 2021 edition

Employment and turnover are only referring to biofuels in transport.
CURRENT RENEWABLE ENERGY POLICY

RES-E
In Belgium the production of electricity from renewable sources is promoted mainly through a renewable quota scheme based on certificates. Offshore wind and hydropower are governed by national regulations. Rights to develop new offshore wind projects are granted based on tenders. Renewable electricity generators can use an obligation the national TSO Elia has to purchase green certificates at a minimum price set by law for offshore wind and hydropower. The minimum price works out as a feed-in premium for offshore wind projects (as well as for medium and large scale PV). The three Belgian regions (Wallonia, Flanders and Brussels) have their own standards for support for renewable energy. All three regions make use of a renewable quota scheme based on a framework from the federal government, including guaranteed price floors for certain technologies. The regional quota schemes may have region-specific features including the level of quotas set. The regions also have regional-specific complementary support measures such as investment premiums (all), net metering (all) and RES obligations on new public buildings (Brussels).

RES H&C
Renewable energy in heating and cooling is supported by the federal government through tax deductions and indirect measures such as RD&D programmes and training programmes for RES-H installers. There are region-specific complementary measures such as a renewable heating quota (Flanders) and zero-percent interest loans for RES-H implementation (Wallonia).

RES-T
Renewable energy use in transport is mainly supported through a federal biofuels quota scheme, which obliges companies importing or producing gasoline, gas or diesel fuels to comply with a pre-set minimum biofuels quota with regard to their annual fuel sales. Furthermore there are two fiscal stimulation measures in place. The first is a reduction in excise tax on automotive fuels, contingent on the share of biofuels in automotive fuels. The second is a full exemption on excise taxes for automotive fuels, applicable to rapeseed oil directly sold by manufacturers thereof to the final consumer.
### Table 1: Brief description of key policy instruments aimed at promoting RES in the Belgium

**For further information:**

What is meant by ...?

Auctions for granting renewable energy support
A support scheme which provides for a technology-specific remuneration per unit of renewable energy payable to eligible renewable energy producers. A proper, periodic review of FIT rates is often undertaken with the aim to prevent both too high FITs so as to minimise regulatory rents, i.e. supra-normal returns and too low FITs to preclude below-target market uptake because of FIT levels that are perceived by market participants to be less attractive. In addition, feed-in tariffs often include “tariff degression”, a mechanism according to which the price (or tariff) ratchets down over time.

Feed-in tariff (FIT)
A support scheme which provides for a technology-specific remuneration per unit of renewable energy payable to eligible renewable energy producers. Typically, a feed-in tariff (FiT) is designed to be technology-specific, with different rates for different types of renewable energy. The principle is to provide a stable income stream to renewable energy producers for the duration of the contract, typically 10-20 years. The FiT rate is announced ex ante, and is often re-set (i.e. adjusted) periodically on the basis of changes in average wholesale market prices, which in turn reflect the average energy wholesale market price, based on a pre-specified benchmark market price. A floating FiT may move freely or may only be allowed to move within a pre-set interval.

Feed-in premium (FiP)
A scheme which provides for a support level per unit of renewable energy to eligible renewable energy producers, typically for a period of 10-20 years, at a pre-set fixed or floating rate. The premium is typically adjusted periodically to exactly offset change in the average energy wholesale market price, based on a pre-specified benchmark market price. A floating FiP may move freely or may only be allowed to move within a pre-set interval.

Grants
Grants are non-repayable funds disbursed by one party (grant makers), often a government department, corporation, foundation or trust, to a recipient, often (but not always) a nonprofit entity, educational institution, business or an individual. (Source: Wikipedia.org)

Green public procurement
In Green public procurement contracting authorities take environmental issues into account when tendering for goods or services. The goal is to reduce the impact of the procurement on human health and the environment. (Source: Wikipedia.org)

Renewable quota scheme (RQS)
A RQS mandates certain market actors (typically retail suppliers or large energy end-users) to respect a pre-set minimum share or amount of their total energy procurements from renewable sources of energy. Typically a tradable green certificate (TGC) scheme is operated to enable the obligated parties to prove their compliance with the prevailing renewable quota target by means of TGCs.

Sliding feed-in-tariff
A FIT scheme which pre-sets technology-specific declining feed-in tariffs for certain prospective vintages in line with the technology-specific learning curve, as projected by the National Regulatory Agency (NRA). Often a degression rate is used indicating the %/annum decrease in the rate level.

Soft loans
Loans at concessional (below market-based) terms, for example at sub-market-conform interest rates, made available in several Member States to stimulate certain renewable energy technologies.

Tax credits
Those are amounts a tax paying entity is allowed to deduct when declaring payable taxes, for example company tax or income tax, to the tax authorities, for example the producer tax credits (PTCs) used in the United States to stimulate among others wind energy deployment.
